# 1 Overview

The RRU3965/RRU3965d is an outdoor remote radio unit which is powered by a power cabinet. It is the RF module of the distributed base station and is installed close to the antenna. The RRU3965/RRU3965d performs modulation, demodulation, data processing, and combination and division of baseband signals and RF signals. By using the software-defined radio (SDR) technology, the RRU3965/RRU3965d can work in GU, GL, UL, or GUL multiple modes through software configurations.

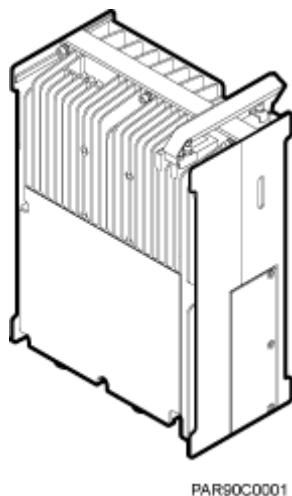

Adopting an innovative design, the RRU3965 can work in 2-TX and 2-RX mode, and the RRU3965d can work in 4-TX and 4-RX mode, which further improve the output power and the carrier capacity.

The software version of the RRU3965/RRU3965d is SRAN11.0, which is compatible with the N-1 and N-2 versions of MBTS, MBSC, and OSS NEs. Therefore, the RRU3965/RRU3965d can be used with products of SRAN9.0, SRAN10.0 and SRAN11.0 versions. All these three versions include the RRU3965/RRU3965d software components. The RRU3965/RRU3965d used in SRAN9.0, SRAN10.0 and SRAN11.0 has no impact on the KPI of products.

	900	-106.0	-109.1	-111.8

 **NOTE**

- The receiver sensitivity of GSM, as recommended in 3GPP TS 51.021, is measured at the antenna connector on condition that the channel rate reaches 13 kbit/s and the bit error rate (BER) does not exceed 0.02.
- The receiver sensitivity of UMTS, as recommended in 3GPP TS 25.104, is measured in the entire operating band at the antenna connector on condition that the channel rate reaches 12.2 kbit/s and the BER does not exceed 0.001.
- The receiver sensitivity of LTE, as recommended in 3GPP TS 36.104, is measured under a 5 MHz channel bandwidth based on the FRC A1-3 in Annex A.1 (QPSK, R = 1/3, 25 RBs) standard.

## 2.4 Typical Output Power

### NOTE

- An RRU3965/RRU3965d that works in the 900 MHz frequency band does not support GSM Only mode.
- An RRU3965/RRU3965d working in UMTS, LTE, or MSR mode and in the 900 MHz frequency band complies with the ETSI EN 301 908 V5.2.1 and 3GPP TS 37.104 standards.
- An RRU3965/RRU3965d working in LTE mode and in the 800 MHz frequency band complies with the 3GPP TS 36.141 standard.
- If an RRU3965/RRU3965d is located at an altitude of 3500 to 4500 meters, its output power reduces by 1 dB. If an RRU3965/RRU3965d is located at an altitude of 4500 to 6000 meters, its output power reduces by 2 dB.
- The output power per carrier in the output power tables indicates the maximum output power supported to ensure network performance.
- When two LTE carriers are configured, it is recommended that the power spectrum density (PSD) of the two carriers be set to the same value. Power spectrum density = Carrier output power/Carrier bandwidth (1.4 MHz and 3 MHz bandwidths are considered as 5 MHz bandwidth in this formula.)

## 2.5 Power Consumption

### NOTE

- The typical power consumption and the maximum power consumption are measured when the ambient temperature is 25°C.
- The typical power consumption for GSM is measured when the load is 30%. The maximum power consumption for GSM is measured when the load is 100%.
- The typical power consumption for UMTS is measured when the load is 40%. The maximum power consumption for UMTS is measured when the load is 100%.
