Hacking & Signing Simplified - Now includes Leftup & BiNPDA certs [Updated 17-MAY-08]

THIS IS THE SIMPLEST OF ALL METHODS TO HACK YOUR PHONE & SIGN ANY APP

Quote:

Update: 17-MAY-08

I have updated the root cert file 00000001.rar and now it includes both - Leftup & BiNPDA certificates. This means that from now on you will not have to sign any BiNPDA release before installing. 🙌🙌

This also saves you from the trouble of installing it manually as described [HERE](#) and also in their release NFO files.

Big THANKS to FCA00000, Leftup & Zorn for making this possible...you guys rocks 🙌

➡ PREREQUISITES:

- Install the **SignSis v1.03 Repacked.sisx** attached to this post on your phone.
- Install X-plore if you don't already have it installed. You can get it from [HERE](#).
- Press **0** in X-plore to bring up the settings dialog and ensure that **Show Hidden files** & **Show system files/folders** are enabled.

- Also ensure that in Application Manager, **Software Installation** is set to **All** and **Online certif. check** is set to **Off**

➡ STEP 1: LET'S HACK YOUR PHONE FIRST

- Install ROMPatcher from [HERE](#)
- Open ROMPatcher and select **Disable caps** from **Options** menu. Then exit from it.

STEP 2: FINAL STEP TO SETUP YOUR PHONE TO SIGN APPLICATIONS

Copy the **0000001.rar** file to your phone. In X-plore, browse to the file and open it.

Then press **4** to extract and select **C:** as destination.

Now browse to the file **C:\resource\swicertstore\dat\00000001**. Press **6** & enable the Read-only attribute for it.

All done! Now you can sign any unsigned app and install it.

TO SIGN ANY UNSIGNED APP USING SIGNISIS:

- Open SignSIS and select unsigned **SIS** file by pressing middle joystick button.
- Select **Selfsign** from **Options** menu.
- The signed file will be placed in the same folder with a **SISX** extension.

To sign your apps on a PC, you should use the cert & key from [Leftup_CertKey.rar](#) with your favorite signing tool.
